

Figure 1: We have isolated the radial velocity of the host star due to the candidate planet. Data begins at UTC 2097-04-05/23:30. Positive values indicate the velocity at which the star is moving towards us; negative indicate the velocity at which it is moving away.

### Parameters of the candidate planet of origin and its host star

Spectral Type	M
Stellar Luminosity (Solar Units)	0.0128
Stellar Mass (Solar Masses)	0.317
Distance to Star (lightyears)	5.5
Planet Mass (Earth masses)	0.7
Atmospheric Pressure (atm)	2.5

### Atmospheric composition of the candidate planet (percent by volume)

Molecule	Concentration
$N_2$	22.3
$CO_2$	9.03
$O_2$	43.2
$H_2O$	25.2
$N_2O$	0.255

### Gas Abundance (percent by volume)

Figure 2: Concentration of various gases in the atmosphere of the candidate planet versus time. Note that the y-axis will usually only show the variation multiplied by some factor, shown in the upper left, and then added to some normal amount, also in the upper-left.

Gas Abundance (percent by volume)

Figure 3: Concentration of various additional gases in the atmosphere of the candidate planet versus time. Note that the y-axis will usually only show the variation multiplied by some factor, shown in the upper left, and then added to some normal amount, also in the upper-left.

Figure 4: Maps of the surface of the candidate planet taken at two different times. Times are indicated above each image relative to the times shown in the radial velocity curve. Those maps are shown here. Tan areas indicate what we believe to be land, while blue-ish areas indicate what we believe to be liquid regions of some kind. Other colors present reflect the visible color as best as we are able to measure.
