A New Pre-Main-Sequence Eclipsing Binary

(Hillenbrand & White 2004, ApJ 604, 741)

There exists a large variation in the evolutionary tracks of PMS stars.

Empirical mass and radius measurements necessary to constrain the models.

A New Pre-Main-Sequence Eclipsing Binary

A new, double-lined PMS EB was discovered in Orion with the FIES spectrograph (fiber-fed echelle, $R = 47000$) at the 2.5m NOT in January 2007.

This radial velocity curve allows us to estimate the masses of the two components with a precision of $\sim 1\text{-}2\%$.

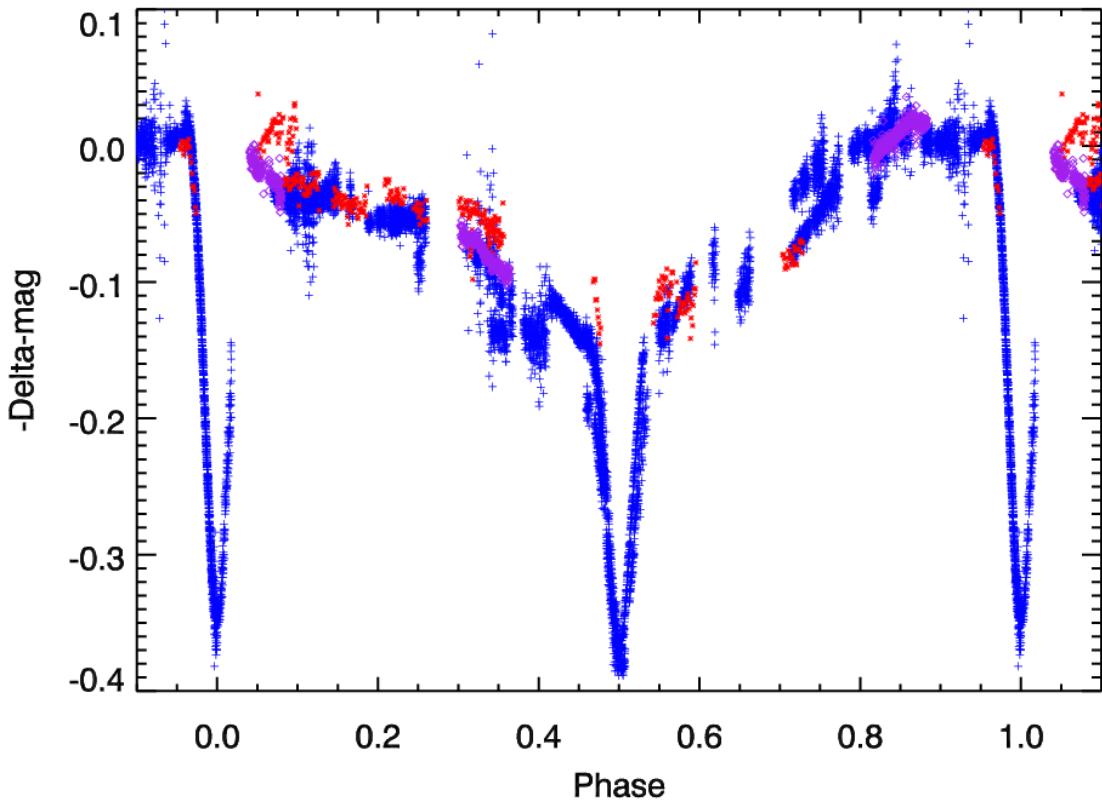

A New Pre-Main-Sequence Eclipsing Binary

The pre-main-sequence nature of this object is confirmed by strong absorption in the $Li\ I$ 6708 line, as well as by emission in H -alpha.

The strength of the Li line indicates a primordial abundance of Li in this system, $\log n(Li) = 3.2$.

A New Pre-Main-Sequence Eclipsing Binary

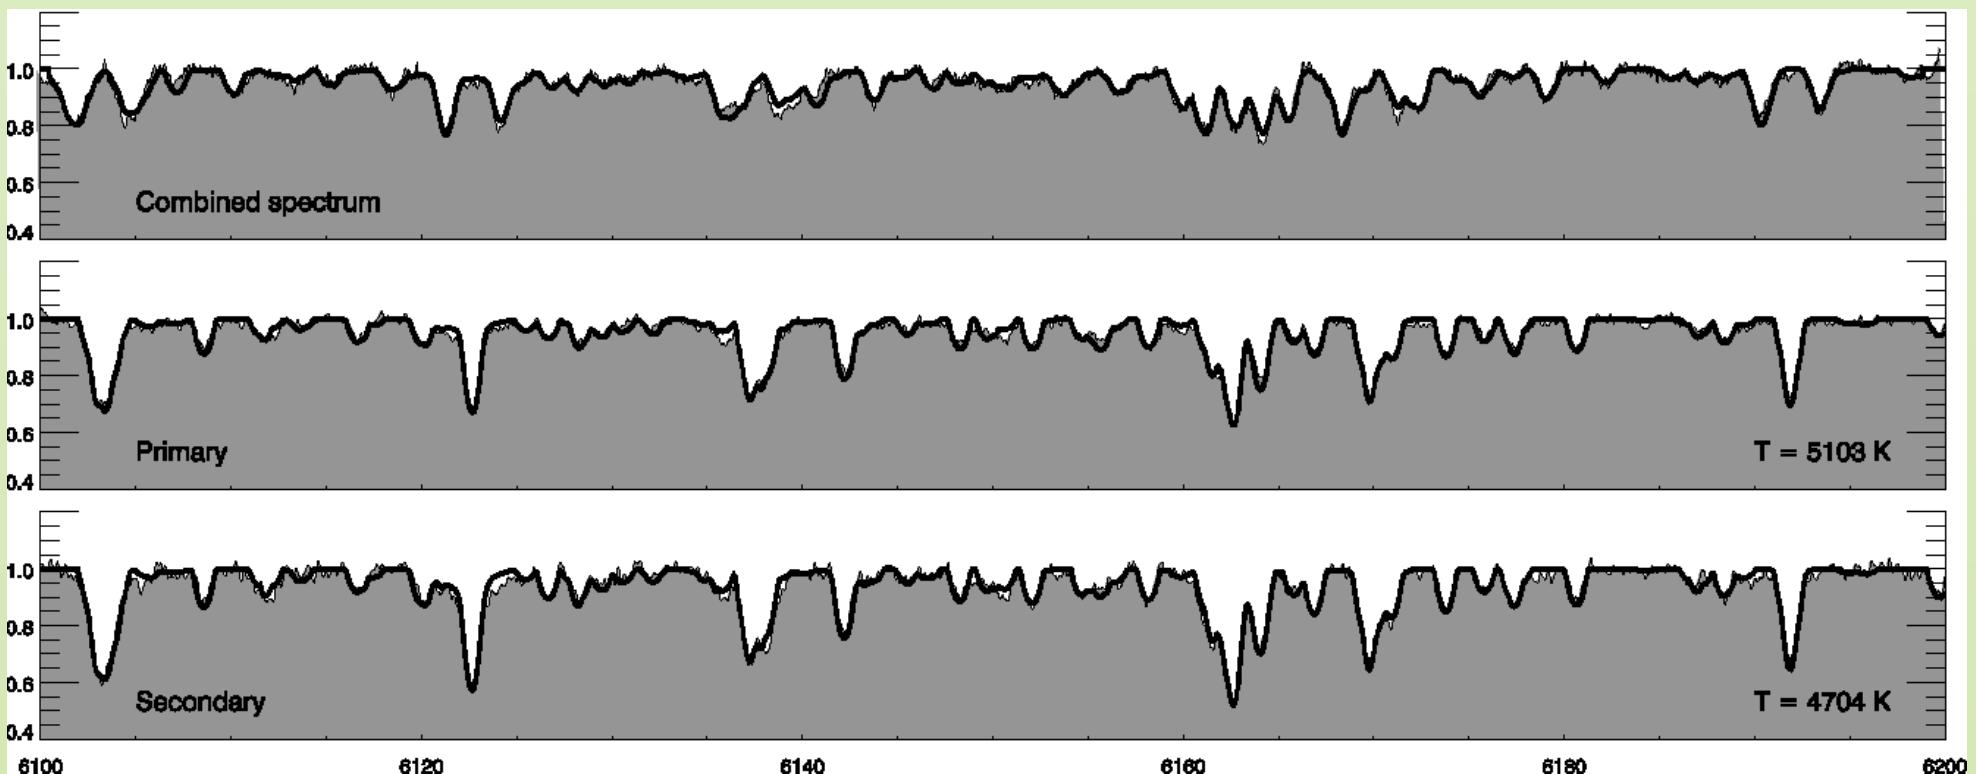

Additional photometry reveals a heavily spotted star, with narrow deep eclipses.

This lightcurve, combined with spectral synthesis and the earlier determined masses, makes it possible to accurately constrain the effective temperatures and radii of the two components.

A New Pre-Main-Sequence Eclipsing Binary

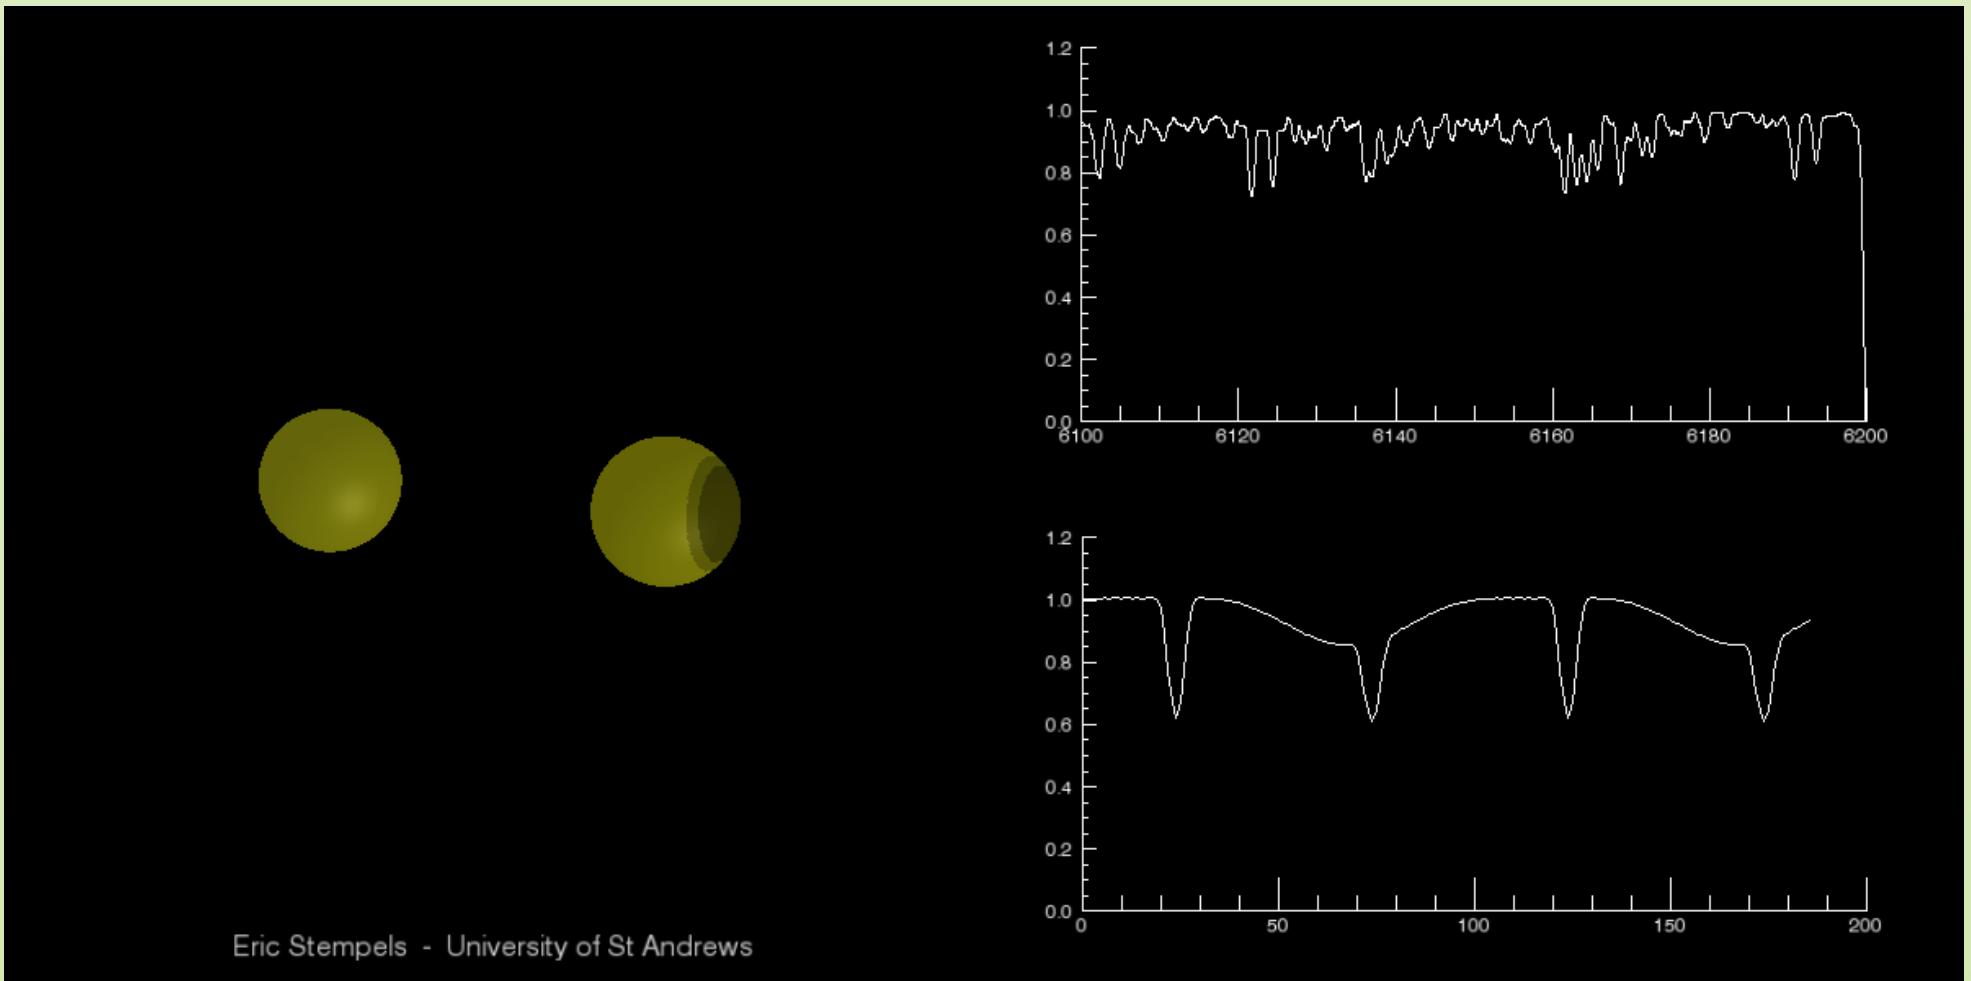

Tomographic separation allows to determine the fundamental stellar (atmospheric) parameters of the individual stars.

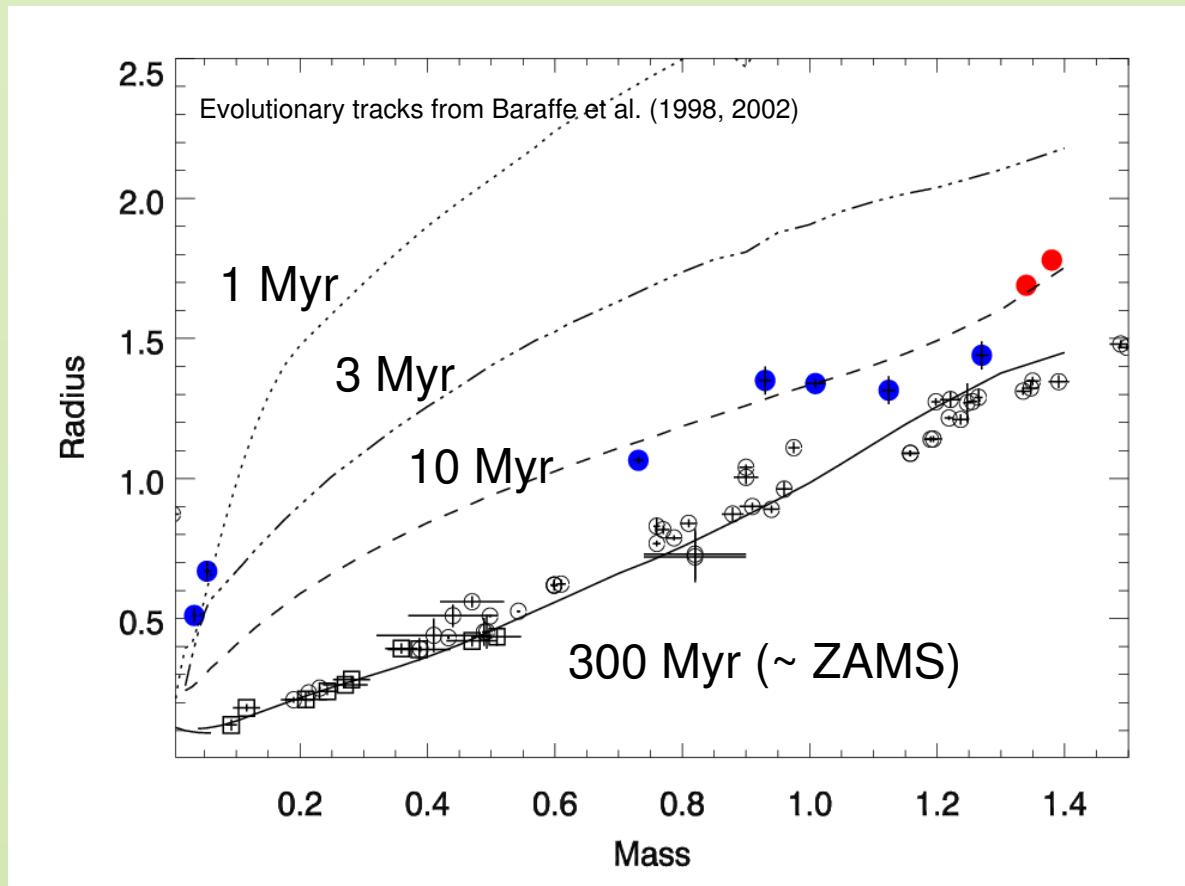

$$T \text{ (primary)} = 5100 \text{ K}$$

$$T \text{ (secondary)} = 4700 \text{ K}$$

A New Pre-Main-Sequence Eclipsing Binary

New PMS EB

Previously known PMS EBs.
(Covino et al. 2004; Stassun et al. 2004, 2006).

Other EBs with measured masses and radii (Andersen 1991;
Hillenbrand & White 2004; Lopez-Moralez et al 2006, and refs.)

Age	~ 11 Myr
Distance	~ 300 pc
$T(\text{prim})$	5100 K
$T(\text{sec})$	4700 K
$M(\text{prim})$	$1.34 M_{\odot}$
$M(\text{sec})$	$1.38 M_{\odot}$
$R(\text{prim})$	$1.69 R_{\odot}$
$R(\text{sec})$	$1.78 R_{\odot}$
$\log n(\text{Li})$	3.2
$\text{EW}(\text{Ha})$	1.0 Å
